Slot: D

Project Title: Campus Resource Exchange Network(CREN): An Intelligent Academic Marketplace for Resource Sharing.

Module Photographs: (3 photographs –Module Photo, Individual student contribution module work in the project and presentation image)

Project Description: (here you write what you did in this project (contribution) including Model Description)

ResourceHub is a student-focused academic resource exchange platform designed to help college students buy, borrow, donate, and swap academic resources within their campus community. The system provides a centralized platform for listing resources such as books, electronics, laboratory equipment, project components, and stationery. It supports user authentication, resource management, exchange requests, transaction tracking, QR-based handover verification, reviews, and trust scoring to make resource sharing more organized, secure, and reliable.

MODULE 3: Exchange Management & Trust System

The Exchange Management & Trust System manages the complete exchange process between students, from submitting and accepting requests to completing transactions. It supports different exchange types such as selling, borrowing, donating, and swapping, while maintaining proper transaction status and authorization. The module also includes QR-based verification for secure physical handover and a trust system based on user ratings and reviews. These features help prevent unauthorized transactions, improve accountability, and build trust among students using ResourceHub.
